## General Land Office (GLO) Survey Plats Skagit County

"The surveyors, as they are respectively qualified, shall proceed to divide said territory into townships of 6 miles square, by lines running due north and south, and others crossing these at right angles, as near as may be, unless where the boundaries of the late Indian purchases may render the same impracticable, and then they shall depart from this rule no further than such particular circumstances may require...As soon as 7 ranges of townships and fractional parts of townships, in the direction from south to north, shall have been surveyed, the geographer shall transmit plats thereof to the board of treasury, who shall record the same, with the report in well bound books to be kept for that purpose."

Land Ordinance of 1785

#### **General Land Office Plats**

Between 1785 and 1930 the United States General Land Office (GLO) contracted surveyors to map the largely unsettled regions of the country for the purpose of subdividing and selling the land to settlers moving west. These maps show the legally binding township and section lines, areas of each section and quarter section available for sale, water bodies and significant natural and cultural features as recorded in the field notes. This work for Washington State began in 1851.

The survey was based on six mile square grids called townships. Each township was then subdivided into one mile square units called sections. Each section is then subdivided into sixteen forties (40 acres). Due to the curvature of the earth adjustments had to be made on the resulting plats. In addition, certain areas of land were not available for sale and the boundaries of the survey stopped at the edge of these areas. Examples of such areas include: Indian reservations, donated land claims, military reservations, some bodies of water and mining claims. Such forties were called government lots.

In the event that information on the scanned images is hard to read hardcopies are available in the Public Works records vault.

#### Measurements:

Acre = 208.7 feet by 208.7 feet (43,560 square feet)

Acre = 160 square rods Acre = 10 square chains

Rod = 16.5 feet Chain = 66 feet

Mile = 5,280 feet Mile = 320 rods Mile = 80 chains
